Department of Materials

APPLICATIONS NOTE

Plasma focussed ion beam

The P-FIB can be used in wide range of scientific, engineering and technological applications

Cross-sectional studies

The focussed ion beam enables access to sub-surface structures; across electrode interfaces, or within integrated circuits.

Patterning at the microscale

Rapid creation of bespoke patterned structures at the scale of hundreds of microns.

Post-service analysis

Automated 3D milling and combined imaging and spectroscopy studies, opens up insights into materials architecture and failure mechanisms. Examine changes to microstructure within the bulk or through degradation and explore the effects of cycling.

mechanical test pieces from specific
regions of interest in novel geometries.

Henry Royce Institute, the UK's national institute for materials science research and innovation, is home to advanced capabilities across nine leading materials research institutions: Universities of Oxford, Cambridge, Imperial College London, Liverpool, Leeds, Sheffield, the hub at the University of Manchester; together with UKAEA and the National Nuclear Laboratory. All Royce-supported and -funded equipment is available for external academic and industrial use.

University of Oxford leads on energy storage activities within the Royce.

At Oxford, the **Department of Materials** hosts a suite of state of the art facilities and equipment. Investment through the Royce contributes to the focus on analysis of energy materials and development of next generation energy storage solutions.

Capabilities at Oxford are backed up by scientists based in the **David Cockayne Centre for Electron Microscopy**, the **Oxford Materials Characterisation Service** and the **Atom Probe Group** – along with the battery research groups of **Professors Peter Bruce, Patrick Grant, Mauro Pasta and Rob Weatherup**.
